Annual Fish Passage Report - Rock Island Dam Columbia River, Washington, 1965

By

PAUL D. ZIMMER, Fishery Biologist (Management)
and
JOHN H. BROUGHTON, Biological Technician (Fisheries)
Bureau of Commercial Fisheries Program Office
Portland, Oreg.

ABSTRACT

Fish were again counted through the fishways at Rock Island Dam, thus providing counts at this location of the 33d consecutive year. Chinook and sockeye counts were down, and coho and steelhead counts were up from 1964. The counts of chinook, coho, and steelhead were larger, and the count of sockeye smaller than their respective averages for 1933-64. The count of salmon and steelhead was exceeded by the count of other species.

Four and one-half percent of the salmon and steelhead passing through the counting gates had injuries.

Daily maximum and minimum water temperatures and daily average rate of stream flow were recorded.

INTRODUCTION

Rock Island Dam, located on the Columbia River about 12 miles downstream from Wenatchee, Wash., has been in operation since 1933, and is owned and operated by Chelan County Public Utility District No. 1.

This report on passage of fish at Rock Island during 1965 provides information on the operation of fishways and the numbers of fish using them.

Rock Island Dam has three fishways: one located on the right bank, another on the left bank, and the third about the center of the dam. The bank fish ladders began operating in 1933, and the middle ladder in 1936. All three ladders have been modified since then.

Fish ascending Rock Island Dam ladders have been counted annually since 1933, the longest continuous record of Columbia River fish counts.

Included in this report are comments covering various fishery investigations at Rock Island Dam during 1965.

COUNTING PROCEDURES

Fish counting in 1965 began on May 1 and ended October 15. From May 1 through August 31, fish were counted 16 hr. (hours) each day, starting at 5 a.m. and ending at 9 p.m. From September 1 through October 15, counting was reduced to 14 hr. each day, starting at 6 a.m.

and ending at 8 p.m. to conform to available daylight.

Fish counters were allowed a 15-min. (minute) rest period at the end of each hour. During all periods of noncounting, the gate at the counting station was closed, and upstream movement of fish was stopped at this point.

A water glass, floated on the surface over each counting board, eliminated sun glare and water surface disturbances and thus permitted clear observation of each fish.

COUNTING OF FISH

All species of fish using the fishways at Rock Island Dam are identified and recorded. Because of their greater importance, the different species of salmon and the steelhead passing the dam are discussed separately.

Chinook, Oncorhynchus tshawytscha

The 1965 chinook count of 36,407 (jacks included) was more than twice the average of 18,061 for the 32-yr. (year) period 1933-64 and was about 72 percent of the record count of 50,713 in 1957 (table 1). Monthly totals of chinook given in table 2 show a peak movement of these fish in July. Maximum day's count of chinook (jacks excluded) was 500 on August 5 (table 3), as compared to 896 on May 5, 1964. Of the chinook (jacks excluded), about 75

Chinook Jacks

Some chinook return from the ocean as mature fish in the year following their seaward migration and are referred to as "jacks." These fish are small, and males predominate. At Rock Island Dam in 1965, all chinook 22 in. (inches) or less in length were counted as jacks. Each counting board has a marked section, 22 in. long, for use of the counter in gaging the length of these small chinook. The

maximum daily count of 557 jacks occurred on September 14 (table 3), 2 days later than in 1964. The 17,113 fish recorded as jacks constituted about 47 percent of the total chinook run as compared to about 36 percent in 1964. In 1965, about 81, 10, and 9 percent of the jacks used the left, middle, and right ladders, respectively (table 5), as compared to about 74, 14, and 12 percent in 1964. Monthly totals are given in table 2.

Sockeye, *Oncorhynchus nerka*
(Blueback or Red)

The sockeye count of 42,379 was about 81 percent of the 32-yr. average of 52,159 (table 1) and less than the 1964 run by 27,032 fish. Peak of the run was reached on July 16, when 2,863 fish were counted through the fishways. Peak daily count in 1964 occurred on July 27 when 6,247 fish were recorded.

Of the sockeye passing Rock Island Dam in 1965, about 69 percent ascended the left ladder, while 18 and 13 percent ascended the middle and right ladders, respectively (table 6). Percentage distribution of sockeye through left, middle, and right fishways in 1964 was about 66, 15, and 19, respectively.

Data pertaining to sockeye daily counts are in tables 9-14. Monthly totals of sockeye counted in 1965 (table 2) show 82 percent of

Table 6.--Semimonthly number and percent of sockeye salmon counted over each ladder, Rock Island Dam, 1965

the total run passed through the fishways in July, as compared to about 79 percent during the same month in 1964.

Coho, Oncorhynchus kisutch (Silver)

The 1965 coho count of 258 was more than three times the 32-yr. average of 80, and about 35 percent of the peak year of 737 in 1962 (table 1). The first coho was observed on

August 17, 1965, as compared to September 11 in 1964. Maximum day's count of 27 occurred on September 29 and October 7. Of the coho passing the dam in 1965, about 84 percent used the left ladder, while 3 and 13 percent used the middle and right ladders, respectively (table 7). In 1964, approximate percent use by ladder was left, 80; middle, 2; and right, 18. Additional data are shown in tables 2, 12-14.

Steelhead, Salmo gairdneri

The 1965 steelhead count of 6,063 was 73 percent greater than the 32-yr. average of 3,506. In 1965, greatest number of steelhead passed through the fishways in September when 2,204 were recorded (table 2). Peak monthly movement of these fish in 1964 also occurred in September when 1,688 were counted.

Of the steelhead passing Rock Island Dam in 1965, about 83 percent used the left ladder, while 7 and 10 percent ascended the middle and right ladders, respectively (table 8). In 1964, approximate percent use by ladder was: left, 76; middle, 10; and right, 14. Maximum day's count in 1965 was 187 on October 7 (table 3), as compared to 129 on September 17, 1964. Additional data pertaining to the movement of steelhead at Rock Island Dam are contained in tables 9-14.

Other Species of Fish

In 1965, species of fish passing Rock Island Dam other than salmon and steelhead were counted as in former years (tables 15-20). No claims are made as to complete accuracy of identification of these fish; however, the degree of accuracy is consistent with that maintained at other dams on the Columbia River. Such data should only be used as a rough index of abundance of these fish.

In 1965, 115,045 fish other than salmon and steelhead passed Rock Island Dam. This num-

ber, as compared to 118,284 in 1964, exceeded the count of salmon and steelhead by about 30,000. The species included are largescale sucker, Catostomus macrocheilus; longnose sucker, Catostomus catostomus; squawfish, Ptychocheilus oregonense; Rocky Mountain whitefish, Prosopium williamsoni; Columbia River chub, Mylocheilus caurinus; carp, Cyprinus carpio; lamprey, Entosphenus tridentatus; Dolly Varden trout, Salvelinus malma; and rainbow trout, Salmo gairdneri.

WEATHER AND RIVER DISCHARGE DATA

Headwater and tailwater elevations are given in feet above m.s.l. (mean sea level) and are plotted in figures 1 and 2.

Air temperatures were taken twice daily by maximum and minimum thermometer. A continuous record of water temperatures was taken by thermograph at the middle fish lad-

der. Daily records of weather and streamflows are shown in tables 9-14.

Maximum daily discharge of 349,900 c.f.s. (cubic feet per second) on June 18 was less than the 1964 record of 451,900 c.f.s. on June 17 (fig. 3).

Maximum water temperature of 66° F. occurred August 12, September 7, 10-12, and 14. In 1964, maximum water temperature of 64° F. occurred August 18, 22, and 23.

Figure 1.--Headwater elevations, Rock Island Dam, May 1 to October 15, 1965.

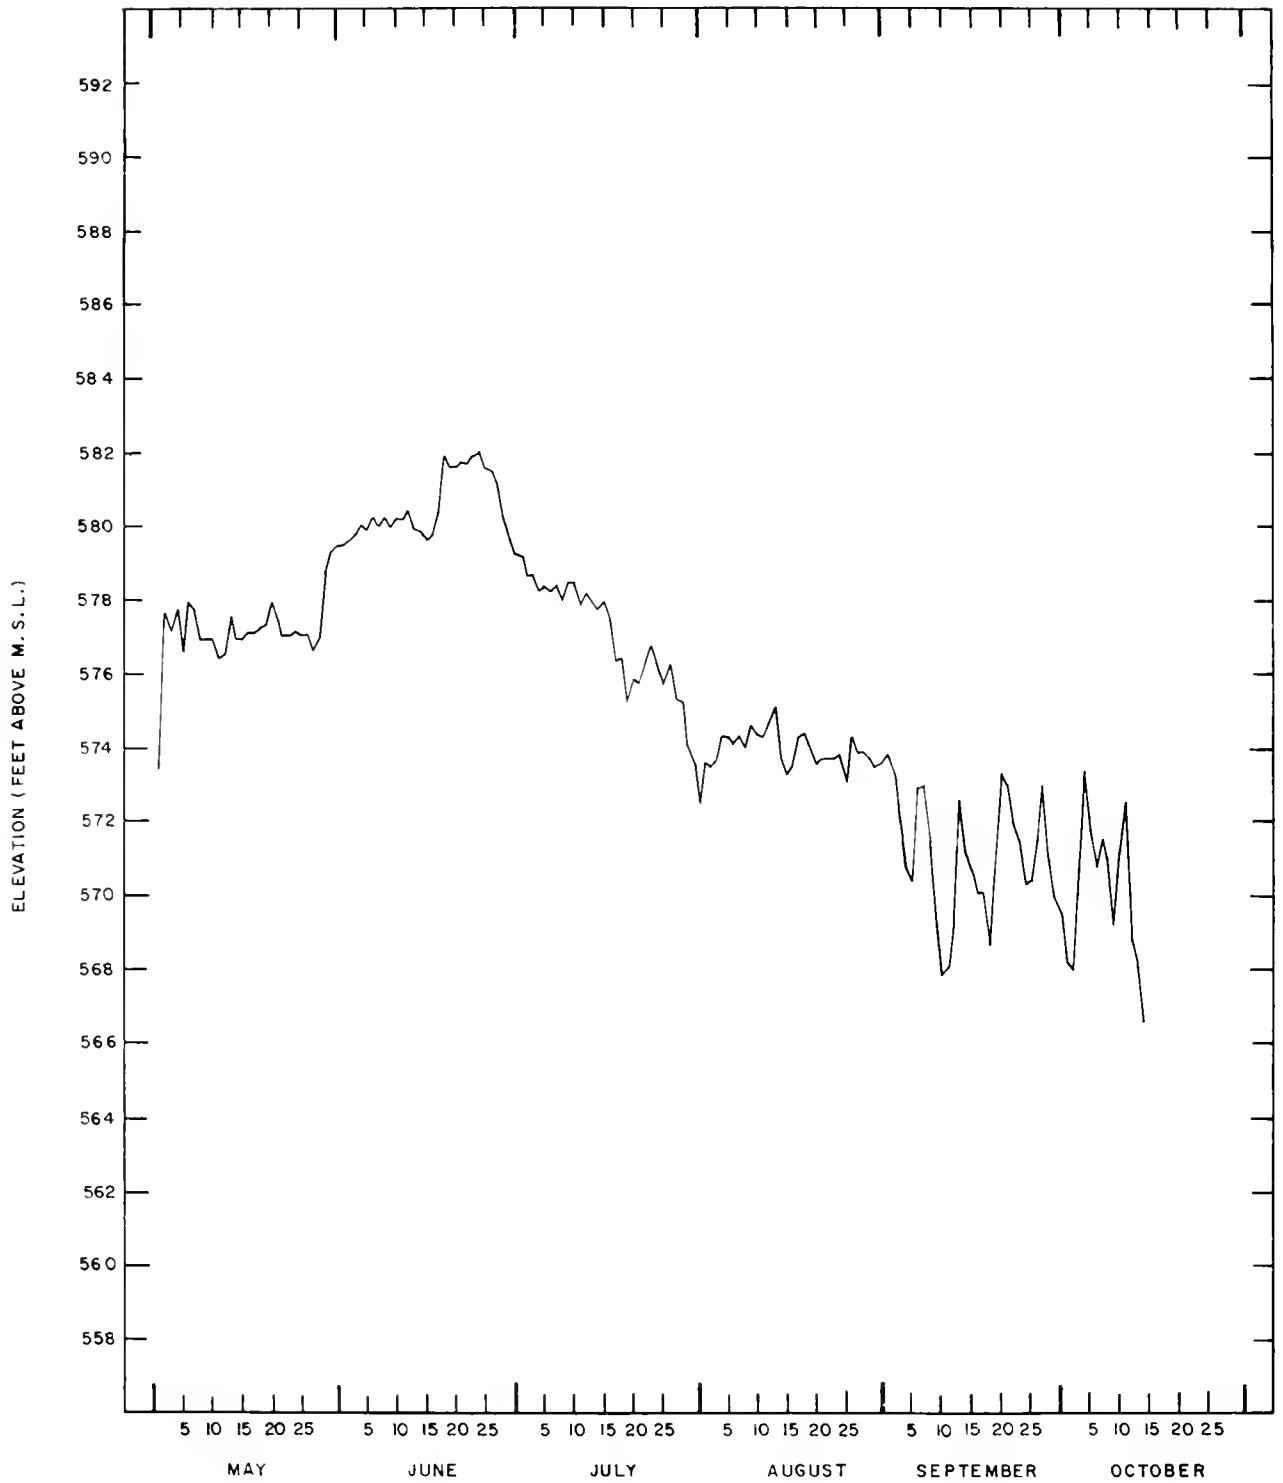

Figure 2.--Tailwater elevation, Rock Island Dam, May 1 to October 15, 1965.

Figure 3.--Daily river discharge, Rock Island Dam, May 1 to October 15, 1965.

ACTIVITIES AND OBSERVATIONS

For 1 day, May 4, normal sequence of spill-way gate operations was changed to determine riverflow patterns for future power generating units.

The waterflow was reduced in the right ladder from 11:00 to 11:30 a.m. and again from 1:30 to 3:40 p.m. on August 6 to repair a broken chain on an adjustable weir.

On August 30, attraction water was discontinued at left ladder entrance at 10 a.m. for removal of grass and weeds from the drop gate screen. Water was restored to the attraction system at left ladder entrance on August 31 at 2:30 p.m.

On September 1, the center ladder was partially dewatered from 12:45 to 2:30 p.m. to allow inspection by a diver of the diffusion gratings in the lower part of the ladder.

On September 16, from 10:25 to 11:50 a.m., attraction water at the left ladder entrance was discontinued to allow a diver to clean grass and weeds from a large screen in front of the drop gate.

On September 20, the center ladder was partially dewatered from 9 a.m. to 4 p.m. to repair a broken chain on an adjustable weir. An open submerged orifice was discovered at bottom of the counting station weir. Fish passing through this opening were not counted.

On September 21, the right ladder counting station was out of operation from 6 to 10 a.m. owing to high water in the pools above the counting weir. This condition resulted from grass and weeds plugging the pickets at the counting station.

On October 1, the center ladder was partially dewatered from 11 a.m. to 5 p.m. to repair a broken chain on an adjustable weir.

On October 5, the attraction water was discontinued at the center ladder from 10:20 to 11:40 a.m. to allow a diver to clean the screen in front of the entrance drop gate.

On October 15, attraction water at the left ladder was discontinued from 10:00 to 11:30 a.m. during removal of grass and weeds from the ladder entrance screen.

As part of an evaluation study of effects of Wanapum Dam reservoir encroachment on the ladders at Rock Island Dam, the Bureau of Commercial Fisheries trapped and tagged fish at the left bank ladder. Chinook were taken in a floating trap at the exit, and sockeye were trapped at the counting station inside the ladder. All fish taken were tagged with numbered Petersen disks and released about 1,000 ft. (feet) below the dam in equal amounts on each bank of the river. Trapping and tagging was performed intermittently from May 16 through June 9 for chinook and July 14 through August 4 for sockeye. During this period, 311 chinook and 679 sockeye were tagged and released. Numbers of tagged fish returning through the ladders were: chinook, 288; sockeye, 626. Twelve chinook tagged by fishery agencies in the lower river were observed passing over Rock Island Dam during the counting season.

During 1965, fish were observed with cuts or abrasions on their heads and bodies. Of the 85,107 salmon and steelhead seen passing over the counting boards, 3,801 fish (4.5 percent) had injuries (table 21). This was more than twice the percentage of injured fish observed in 1964. Because in both years the counters could see only the top and one side of each fish, the incidence of injury might have been greater than observed. Of the total number of injured fish observed in 1965, about 67, 22, and 11 percent were recorded in the left, middle, and right ladders, respectively. In 1964, these percentages were 56, 23, and 21. As in previous years, the greatest number of injuries was observed on the large chinook and sockeye. In the 2-wk. (week) period July 16-31, 26,691 sockeye were counted through the fishways and injuries were noted on about 8 percent. In 1964, during the same period, about 2 percent of the sockeye observed had injuries.

Throughout the counting season, State and Federal fishery personnel made frequent inspections of fishway operations at Rock Island Dam. Inspections were similar to those at other main stem dams where fishways were operated.

SUMMARY

1. Total Rock Island Dam count of salmon and steelhead in 1965 was 85,107, about 30,000 less than in 1964.

2. The chinook count of 36,407 (jacks included) was 3,544 less than in 1964, more than two-thirds the peak year of 1957, and exceeded the 32-yr. average by about 18,300 fish. In 1965, 17,113 jacks were recorded, representing about 47 percent of the total chinook counted. In 1964, jacks represented about 36 percent of the chinook run.

3. The sockeye count of 42,379 in 1965 was less than the 1964 count by 27,032 fish and was less than the 32-yr. average of 52,159.

4. The coho count of 258 in 1965 was more than three times greater than the 32-yr. average of 80 fish and was about 35 percent of the peak year 1962 when 737 were counted.

5. The steelhead count of 6,063 in 1965 was 1,047 more than the 1964 count of 5,016 and 2,557 more than the 32-yr. average of 3,506.

6. In 1965, as in previous years, a greater percentage of salmon and steelhead used the

left bank fish ladder than either of the other ladders.

7. Counting began May 1 and ended October 15. From May 1 through August 31, fish were counted 16 hr. each day; from September 1 through October 15, counting was reduced to 14 hr. each day, 6 a.m. to 8 p.m. to conform to the hours of available daylight.

8. In 1965, maximum number of salmonids counted in 1 day (3,340) occurred on July 16, as compared to 6,866 on July 27, 1964.

9. Season's total fish other than salmon and steelhead passing Rock Island Dam in 1965 was 115,045, composed of the following: sucker, 71,662; squawfish, 28,317; whitefish, 4,961; chub, 4,982; carp, 444; lamprey, 4,475; Dolly Varden and rainbow trout, 204.

10. Of the 85,107 salmon and steelhead examined, on the top and one side only as they passed over the counting boards, about 4.5 percent had injuries of some type either on the body or about the head. Most injuries were observed in July and August, and were more numerous among the larger chinook and sockeye.

Created in 1849, the Department of the Interior--a department of conservation--is concerned with the management, conservation, and development of the Nation's water, fish, wildlife, mineral, forest, and park and recreational resources. It also has major responsibilities for Indian and Territorial affairs.

As the Nation's principal conservation agency, the Department works to assure that nonrenewable resources are developed and used wisely, that park and recreational resources are conserved for the future, and that renewable resources make their full contribution to the progress, prosperity, and security of the United States--now and in the future.
